- (12.00p.m. - 4.00p.m.)

Description

Lek Veterina d.o.o. is a producer of premixes and mineral vitamin mixtures. Besides production our main activities are also orientated into sales of premixes, mineral vitamin mixtures, nutraceuticals and products for improving animal health. Lek Veterina d.o.o. is a medium-sized company and with its headquarter in Lipovci near Murska Sobota, Slovenia. Employees are skilled workmen, technicians, technologists and animal nutrition experts. Lek Veterina is theoretically a rather young company founded in 2005 with separating from Pharmaceutical Company Lek, which is one of the two significant generic pharmaceutical producers in Slovenia, now part of Novartis, Switzerland. Still our experience and knowledge go 30 years back. Our production was put up in 1980 at the heart of Slovenian agricultural area, from where we have served the entire area of former Yugoslavia. Relationship with pharmaceutical company has dictated the foundations for a quality production to which we have added a concern for the production of safe food for animals and people. Quality, knowledge and integrity are our core values that guarantee a successful cooperation with our business partners. Production is carried out in accordance with the requirements of various international principles and standards, which we have mentioned in our Quality Rules Manual. Our activities are orientated into production and sales of premixes, mineral vitamin mixtures, supplemented feed mixtures and veterinarian products for improving animal health. In last few years we are developing more and more liquid products for supporting animal production weather with vitamins and amino acids or even with natural plant extracts. We are sharing many years of experiences acquired in company Lek, obligation to pharmaceutical standards and quality with veterinarians, farmers, farm advisers and other agricultural experts from countries in central and south-east Europe. Following trends in animal nutrition, health and welfare and a various choice of feed additives (probiotics, prebiotics, coccidiostatics, enzymes, pigments, flavours, herbal essential oils, fatty acids and others), that can be homogeneously mixed into premixes and vitamin mineral mixtures in smallest amounts, enables us to produce a product that meets the demands of our buyer.
