IRRIGATION and GREEN HOUSES

IRRIGATION

We are producing an up-to-date systems for localized irrigation of fieldcrops, garden produce, orchards, nurseries, green houses, vegetables and flowers under plastic covers, gardens, parks and other green surfaces.

In planning the systems, every specific economic, agronomic, topographic, pedological, hydrological and climatic constraint and demand is taken into account. Irrigation systems can be composed with control head (water supply, pumps, fertirrigation, regulation and automation, hydrants...), primary pipes, lateral pipes with drippers, minisprinklers, gun-sprinklers...

Each plant requires its own particular way of irrigation or even its own type of sprinkling (dripping). Consequently we have prepared a wide choice of Ageapol distribution elements, so that we can satisfy all the requirements.

GREEN HOUSES

We produce and mount wide range of green houses of various sizes and shapes:

- small plastic covers at higher prices, which can lean against other buildings or can stand by themselves, and whose quality is appropriate for the production of food for individual needs.
- semi-professional plastic covers for surfaces from 30 to 150 square meters, without additional equipment, assuring economical production out of season - i.e. in intermediate times (winter-spring and autumn-winter)
- professional green-houses, of different sizes and shapes for the whole year production, with regulated climatic conditions: a large variety of constructions are available (plastic, metal), the same goes for coverings (glass, PeS, multi-strata hard covering PC, EVA or PE folio,...) and additional fitting (irrigation system, heating, cooling, automatic regulation, aeration, shading, mulching, supports, etc.).

Cooperation Offered

1. Manufacturing agreement
2. Sales / Distribution
